Heating made for your home

The choice is yours

Combi boiler

A combination (or combi) boiler powers your central heating and hot water requirements from a single compact unit.

Perfect for smaller properties, combi boilers heat water directly from the mains when you turn on a tap. This has two main advantages. Firstly, hot water is delivered at mains pressure, so you should enjoy a lovely, powerful shower. And secondly, because water is heated 'on demand' you won't need a hot water storage cylinder, saving valuable living space in your home and reducing pipework costs – and the cost of a cylinder – at installation.

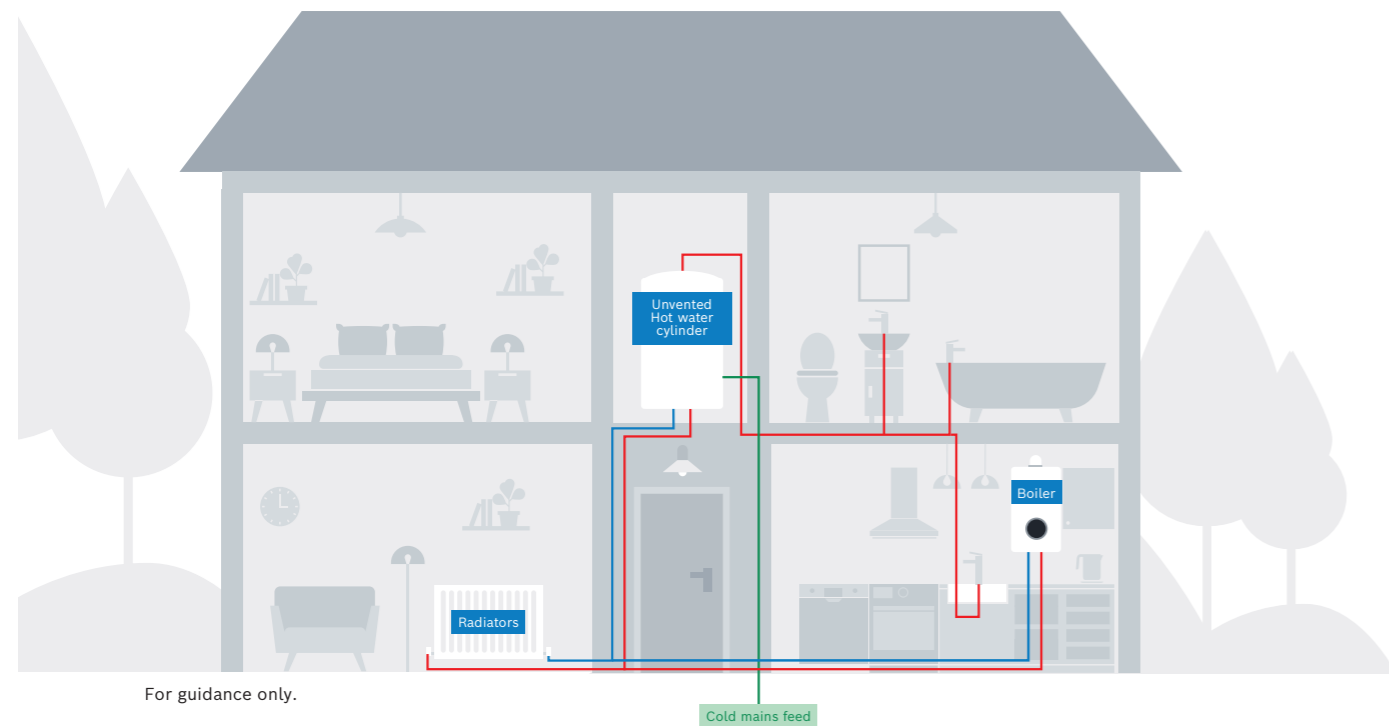

- ▶ **Very cost effective and energy efficient because water is only heated when needed, rather than being heated and then stored in a cylinder**
- ▶ **There are no additional tanks, freeing up valuable loft space – useful if you plan to convert the loft in the future. Plus, there's no risk of loft pipework freezing.**

Heating made for your home

The choice is yours

System boiler (sealed system)

System boilers are all about busy homes, using a storage cylinder to store hot water for whenever you need it.

It means you can enjoy a large supply of hot water to any number of taps, making it ideal for homes with more than one bathroom. All the main parts are built into the boiler itself, so it's quicker, easier and neater to install than a regular boiler.

System boilers are also compatible with solar water heating, so if that's an option for your home, you can take advantage of renewable energy to reduce your home heating bills and your carbon footprint.

- ▶ **Economical to run**
- ▶ **No need for a loft tank, freeing up space and eliminating any worries about loft leaks or frost damage**
- ▶ **A regular boiler can also be installed on a sealed system with a generic sealed system kit and an unvented cylinder.**

Regular boiler (open vented system)^

A regular boiler (sometimes known as traditional, conventional or heat only boilers) can be a good choice in areas where water pressure is low, where there are two or more bathrooms, or if your family needs a lot of hot water at the same time.

These boilers need a separate hot water cylinder, a cold water storage tank in the loft to feed it, and an additional tank to maintain the water level of the central heating system.

- ▶ **Can be a good option to replace an existing boiler in a home with an older radiator system that might not cope with the higher water pressure delivered by combi or system boilers**
- ▶ **Compatible with solar water heating systems for a lower carbon footprint and lower energy costs.**

[^]The diagram above demonstrates a regular boiler set up in an open vent system.

Changing your heating system

What you need to know

Energy efficiency

Visit the Energy Trust website to compare your boiler with replacement options, to find and estimate your potential savings.

Future-proofing

Choose a boiler that will suit you long term. If you're planning on renovating or extending, new bathrooms will mean more hot water demand, so make your decision with today and tomorrow in mind.

System cleanliness

Look after your boiler and your boiler will look after you. By regularly flushing the system and adding inhibitor, you'll prevent debris and dirty water, keeping your heating healthy.

System filter

System filters will protect your heating from damage and keep your boiler running efficiently for years to come. During your annual service, they'll be cleaned and checked.

Pipe upgrades

If you're upgrading your boiler or changing to a different type, your installer may need to fit new pipework to provide higher flow rates or more efficient heating.

Peace of mind

Your guarantee helps you keep safe from expensive repairs and replacements. Always check your guarantee details, they vary between installers.

Expert installations

Professionals at every stage

The accredited experts

Home heating doesn't get better than this. By choosing a Worcester Bosch Accredited Installer you can be assured they have expert knowledge of our product ranges.

Gas Safe registered

Our network of Gas Safe Registered independent installers are ready to help you choose the right boiler for your home.

Easy installations

Changing your heating system

1. A home survey

A local installer will visit your home and discuss the different options available.

Your installer will also show you the different controls and recommend the best one for the features you want – like zone heating, remote functionality, or weather compensation.

2. Getting a quote

Your installer will give you a quote after their visit, for supplying and fitting the boiler, which should include the following work:

- ▶ Power flushing the heating system
- ▶ Controls
- ▶ Any system changes that may need to be carried out, such as pipework changes
- ▶ System filter
- ▶ System chemicals

The overall cost of the boiler and installation will depend on the boiler, system type, and location in your home.

3. Installation day

Most like-for-like boiler replacements can be carried out in a day, but more complex jobs might take between 1–3 days.

4. Enjoy your cosy home

Once your installer has finished and shown you how everything works, you can start enjoying your warm, comfortable home.

To keep your guarantee active and your heating healthy, you'll need to arrange an annual boiler service. Contact your installer and try to organise it during the summer, so you're not caught out when it gets cold and installers get busy.

Top tip:

Getting your boiler changed can be the perfect opportunity to sort other heating or plumbing issues in your home. From fitting an outdoor hot water tap to clean the dog, to adding an extra radiator in a colder part of your home – it's a great opportunity to get those small jobs ticked off.

Top customer care

Ongoing support and peace of mind

We're here when you need our support. Our award-winning home heating experts are always on hand, ready to answer every question you have.
